EDT understands commitment to sustainable design and the necessity of designing facilities with minimal impact to the environment.

Engineering Design Technologies (EDT) is totally committed to ensuring that buildings are responsibly designed to benefit both the end-users and contribute to environmental sustainability. At the beginning of a project EDT schedules a pre-design meeting including its design team and the client project team members, potential new design professionals and construction team members. At this meeting EDT uses LEED® to establish a strategy for meeting the sustainability goals for the project, identifies all individual credits feasible to reach the LEED® certification and ensure that costs associated with this strategy are captured. The quality of this effort greatly influences the project's success in achieving Sustainable Design and Development goals. The strategy is documented on a LEED® Project Checklist.
